[Contact Utah Flood Cleanup](#) at **(801) 416-2666** for a ***free consultation***.

Water Damage from Pipe Leaks Must be Treated Immediately

Standing water is a pernicious problem that only gets worse if left untreated. Water can seep into electrical conduits damaging critical systems. It can find its way into HVAC systems causing unsafe respiratory conditions. Moisture on floors, catwalks and other areas your employees use can cause significant personal injury through slipping and falls.

While standing water is an obvious problem, ***moisture that you don't see can be even more destructive.*** It will continue damaging your property and will create ***health risks*** for your employees. As it soaks into wooden architecture, it will warp and weaken its structure. Doors that don't close correctly and veneers pulling away from floors are the least of your worries. Wood rot can create dangerous working conditions leading to injuries as its ability to bear a load is decreased. Over time, rot can lead structural failure putting your company's building at risk.

Similarly, the lifespan of furniture, carpets, and documentation are severely curtailed by water contact and moisture. Even worse, neglected moisture provides conditions for ***dangerous mold to form***. Mold will damage your carpets, wooden structures, cardboard, paper and a multitude of other items to feed itself and grow. It is also endangering the health of your employees.

The Pipe Leak Water Damage Cleanup and Remediation Process

The faster water and moisture are removed from your building, the lower the likelihood of serious damage occurring to your property. Professional cleaners and remediators work quickly to dry and dehumidify your entire site. All affected areas including crawl spaces, conduits, and cable runs will be checked for standing water and damage, and then repaired as necessary. Water marred carpets, furniture, and appliances will be dried and cleaned. If necessary, damaged ceiling tiles, sheetrock, and other building materials may need to be repaired or replaced.

If mold is discovered during the cleanup process, we are ***certified mold removal & remediation specialists***. Mold removal is a tricky process that involves specific tools and prescribed cleaning methodology. In addition to removing visible mold and mildew, abatement of mold spores is part of the process to make sure it cannot return.

If You've Experienced Water Damage from a Pipe Leak, Call in the Professionals at Utah Flood Cleanup Today
